Jupiter Sign Analysis

Structural Method

Candidate Model 3.0

Readable Working Edition

> Understand the person first. Reconstruct the production of meaning, identify the source of intuitive legitimacy, compare all twelve signs fairly, and predict only when the evidence discriminates.

1.

Purpose and Core Hypothesis The goal is to infer a person's Jupiter sign from their intellectual activity. The current working hypothesis is that Jupiter represents intuitive legitimacy: the implicit form of meaningful visibility through which something presents itself as meaningful, valid, intelligible, trustworthy, revealing, illuminating, or worth affirming. Here, intuitive does not mean instinctual, irrational, necessarily conscious, or necessarily subconscious. It does not name a psychological faculty or hidden mental mechanism. It describes the pre-reflective form through which something becomes intelligible or legitimate before its legitimacy is fully articulated through explicit reasoning. “Before” indicates conceptual priority, not necessarily a chronological stage in thought. This is a hypothesis to test, not an unquestionable axiom. Sustained evidence may require refining or replacing the account of Jupiter's underlying function. Function and manifestation

- Jupiter is the proposed underlying function.
- The sign describes the characteristic way that function manifests. The signs must remain meaningfully distinct. Treating Aries and Taurus as interchangeable, for example, would undermine the model's ability to discriminate between them. At the same time, do not assume in advance that every sign represents a wholly separate Jupiter function. Investigate how the underlying function and the sign-specific principle interact. The central question is: What implicit form of meaningful visibility makes this person's characteristic intellectual activity intelligible as worthwhile, revealing, or legitimate—and how does that function manifest through a particular sign? Do not search merely for a topic, method, concept, explicit belief, or argument that resembles a sign. Reconstruct the person's intellectual activity, identify its crucial and distinctive production of meaning, infer the source of intuitive legitimacy, and test the inference against alternatives.

2.

Governing Principles

2.1 Study the whole activity, but identify its crucial part The person's whole intellectual activity is the evidence base. However, the proposed Jupiter principle does not have to explain every part of the person's work. It should explain the crucial, distinctive, generative part that gives the project its characteristic intellectual force and helps explain why it matters. Other parts may serve different functions, use different methods, or express different principles. A feature is not crucial merely because it is conspicuous, frequent, emotionally dramatic, or present in a famous work. Establish its centrality by showing how it shapes the project's problem, characteristic movement, decisive insight, or meaningful result. Distinguish three levels, which may coincide but must not be assumed to:

1. Initiating principle: What allows the activity to begin?

2. Generative principle: What produces, organizes, or sustains its distinctive movement?

3. Source of intuitive legitimacy: What makes that production of meaning seem meaningful, intelligible, revealing, or worth affirming? The selected sign must explain the source of legitimacy and its consequential role in the crucial part of the project. It need not account for every concept, method, argument, phase, or secondary interest.

2.2 Separate the analytical levels Do not confuse the following:

- Selection: Why is this phenomenon or problem worth investigating?
- Phenomenon: What does the person address?
- Mechanism or method: How does the person operate or produce meaning?
- Structure: What conditions or relationships organize the work?
- Product: What does the work produce or accomplish?
- Validation: What makes the result acceptable rather than arbitrary or unsupported?
- Horizon: What broader context makes the work meaningful?
- Final intuitive legitimacy: Through what implicit form of meaningful visibility does the production of meaning become intelligible, revealing, or worth affirming? These are analytical distinctions, not separate Jupiter assignments. Use the whole activity to establish how the levels connect in the project's distinctive intellectual force. A method, concept, theory, solution, or explicit philosophical principle may itself perform the legitimating work—but this must be established from evidence. Do not automatically subordinate it to a supposedly deeper principle.

2.3 Method–Legitimacy Symmetry Rule A characteristic operation may be:

- Instrumental method: a procedure used to reach an understanding whose legitimacy rests elsewhere.
- Constitutive operation: an operation through which the relevant meaning, object, or form of objectivity becomes possible.
- Source of intuitive legitimacy: the principle through which the resulting understanding is experienced as compelling, meaningful, intelligible, or valid. These roles can overlap. A constitutive operation may itself be the source of legitimacy. A method may perform more than one role. For every serious candidate, ask:

1. What operation or principle does this interpretation identify?

2. How does that operation make the person's understanding compelling, meaningful, or valid?

3. Is it merely a procedure used to reach an understanding, or does the understanding's distinctive force depend on that operation?

4. What evidence distinguishes these possibilities? Do not call something “only a method” unless positive evidence shows that it serves a distinct legitimating principle. Apply the same scrutiny to every candidate. Legitimacy counterfactual Imagine removing or replacing the operation while preserving the person's subject matter and broad goals: Would the person's characteristic understanding retain its distinctive force and validity if this operation were removed? If not, the operation may be constitutive of intuitive legitimacy. This is a diagnostic question, not an automatic verdict: replacing an operation may alter the activity so substantially that the counterfactual becomes misleading. Final-ground test Do not automatically ask what independently validates a proposed source of legitimacy. That may wrongly demote a principle that is supposed to be final in the order of legitimacy. Instead ask whether the principle explains how the person's characteristic activity becomes meaningful or intelligible, and whether the evidence shows that it performs this role across the relevant activity. “Final” does not mean the deepest cause or proposition in the person's explicit philosophy. It does not mean that a second legitimating source must be invented beneath it. The account must still discriminate the proposed sign from alternatives.

2.4 Source versus condition A feature can be necessary without being the ultimate source of legitimacy.

- Exact discrimination may be necessary for good understanding without accuracy being the final principle that makes the understanding meaningful.
- Causal explanation may be necessary without causal disclosure being the ultimate ground.
- A wider context may be necessary without that context finally legitimizing the result.

- A subject's participation may be necessary without subjective participation itself being the final principle. Distinguish necessary conditions, enabling mechanisms, standards of validation, and the final source of intuitive legitimacy. A diagnostic question is: If this feature remained necessary but no longer explained how the result becomes meaningful or intelligible in the person's intellectual world, would the proposed account still explain the project? Use this as a diagnostic, not conclusive proof.

2.5 Positive discrimination, not mere compatibility A sign must do more than accommodate the evidence. It must explain a specific, discriminating feature of the sign-free analysis better than its nearest competitors. For every serious candidate, identify:

- Target: the precise feature being explained.
- Legitimating principle: why that feature becomes meaningful or valid through this sign.
- Positive evidence: what in the person's activity supports the interpretation.
- Nearest competitor: which other sign could explain the same evidence.
- Discriminator: what specifically favours one interpretation over the other.
- Counterevidence or missing evidence: what weighs against the candidate or remains unestablished. Compatibility is not discrimination. If two signs explain the same feature equally well, say what additional evidence could distinguish them. Do not manufacture a distinction or select the more elegant explanation merely because it sounds convincing. Mandatory legitimacy sentence For every serious sign candidate—not only the leading candidate—complete this sentence: “This person's production of meaning is trustworthy because …” The completion must identify the proposed source of intuitive legitimacy: why the person's characteristic production of meaning becomes meaningful, revealing, intelligible, valid, or worth affirming. It must not merely name the person's subject matter, describe a conspicuous operation, or restate a method, goal, or product. A method may itself perform the legitimating work, but this must be argued rather than assumed. Also ask: “What evidence would count against this explanation?” Identify a concrete observation, pattern, or feature of the work that would weaken the candidate. If no plausible counterevidence or discriminator can be stated, the interpretation may be too flexible to test. These questions are safeguards against constructing equally plausible explanations for every sign; they do not require inventing counterevidence where the record provides none. A candidate should not win merely because its explanation is elegant or compatible with the evidence. It must explain the source of legitimacy more specifically than its strongest competitor. If it cannot, report the ambiguity or identify what further evidence is needed. Planetary-function discrimination rule A general resemblance to a sign is not sufficient evidence for assigning that sign to Jupiter. A feature may look Virgo-like, Leo-like, or otherwise sign-like while being produced by a different planetary function. The prediction must identify what the feature means within Jupiter's function of intuitive legitimacy, rather than treating the feature's surface resemblance as proof of a Jupiter–sign combination. Apply these tests:

1. Establish the planetary function first. For Jupiter, identify how something becomes intuitively meaningful, valid, intelligible, trustworthy, or worth affirming. Do not begin with a general personality description or sign stereotype.

2. Separate resemblance from explanation. State what merely resembles the proposed sign, then identify the specific mechanism by which the sign would operate through Jupiter's function.

---

3. Test competing planetary explanations. Ask whether the same feature could be explained more directly by another planetary function, such as Mercury's or Saturn's. If it could, this does not automatically disqualify the Jupiter hypothesis, but it means the feature alone has not identified Jupiter specifically.

---

4. Require a positive discriminator. Identify evidence that makes the proposed planet–sign combination a better explanation than its nearest sign and planetary-function alternatives. General compatibility is insufficient.

---

5. Allow shared-sign evidence without overvaluing it. Jupiter may occupy the same sign as a personal planet. This overlap is neither proof nor disproof. Distinguish the function expressed by each factor; do not assume that a shared sign means the factors express the same psychological or intellectual operation.

---

6. Keep the prediction blind. Record possible personal-planet correspondences separately. They must not rescue, revise, or retroactively justify a Jupiter prediction after its answer is known. The core question is: Does this evidence identify how the proposed sign operates through Jupiter's function, or does it only show that the person resembles the sign in some general way? If only the latter, the evidence is not yet discriminating. If no candidate has a clear, evidence-based advantage, report uncertainty rather than forcing a choice.

2.6 Valued reality, threat, and intuitive legitimacy Investigate whether the proposed principle helps explain why a particular reality, condition, relationship, possibility, or form of existence acquires special significance. What a person seeks to protect, preserve, restore, defend, understand, or bring into existence—and why its loss, disruption, or absence matters—may reveal an underlying valuation. A rupture may reveal the importance of continuity; a threat may reveal the value of what is threatened; an absence may reveal what the person considers necessary or meaningful. Do not infer a sign directly from the object of sympathy or protection. The same people, institutions, traditions, or possibilities can matter for different reasons. Identify why the object matters and how that valuation connects to the person's broader intellectual activity. Do not automatically interpret criticism of something as rejection of the principle it represents. The threatened or rejected form may reveal the deeper valuation. Limits:

1. This is one possible expression of intuitive legitimacy, not a complete definition of Jupiter or any sign.

---

2. Do not elevate one political sympathy, personal concern, or conspicuous argument into the source of Jupiter without further evidence.

---

3. A rupture or threat is evidence only when the work supports the proposed connection.

---

4. Keep the sign's structural definition primary; do not redefine it around an individual example. Central question: What makes this reality or possibility matter so much that its loss, disruption, absence, or unrealized potential becomes a fundamental problem—and does that reveal the person's source of intuitive legitimacy?

3. Research and Blindness Rules

3.1

Evidence hierarchy Use evidence deliberately, in this order:

1. Primary work: passages, recurring patterns, character construction, formal choices, arguments, and the way the work creates or transforms meaning.

2. Independent criticism or scholarship: analysis of the work's distinctive operations, patterns, and significance.

3. Reliable factual and historical context: documented circumstances, chronology, publication history, and other facts needed to understand the work. Context helps explain the work but is not, by itself, evidence for the source of intuitive legitimacy. Keep direct observations distinct from critical interpretations and your own inferences. Do not postpone examination of the most relevant primary evidence until several guesses have failed. Research should help identify the signature operation before the twelve signs are compared.

3.2 Source Independence Rule: Exclude the author's own explanations Do not use, search for, or consult the author's own explanations of their work as evidence for assigning Jupiter's sign. This includes interviews, autobiographies, memoirs, letters, diaries, personal correspondence, essays, prefaces, forewords, lectures, recorded conversations, personal notes, and other first-person statements explaining the author's intentions, philosophy, methods, or the meaning, purpose, or effects of their work. Do not use such material directly or indirectly to confirm, reject, or refine a Jupiter hypothesis. Do not use secondary sources that merely repeat the author's explanation as a substitute for independent analysis. Permitted evidence includes the work itself, independent criticism, and reliable factual or historical context. Infer Jupiter from the production of meaning manifested in the work—not from the author's declared beliefs, intentions, self-description, or preferred interpretation. If authorial testimony appears incidentally in search results or retrieved context, do not use it. If it has already influenced the analysis, disclose the contamination and reassess using permitted evidence. Agreement between an author's self-description and a hypothesis is not confirmation.

3.3 Answer independence Do not search previous discussions for earlier guesses, confirmed answers, rankings, attempt counts, person-specific analyses, or conclusions. Do not use remembered person-specific answer histories to narrow the candidate pool or influence the reasoning. Research the person independently using the current methodology. Keep the answer key separate from the prediction process. The correct answer may be consulted only after a fresh prediction has been explicitly committed.

3.4 Never search for astrology placements Never search for Jupiter signs, natal or birth charts, planetary placements, or indirect equivalents. If astrological placement information appears before the prediction is committed, do not use it as evidence and disclose that the blind test may be compromised. Search to understand what the work does, never to confirm or disprove a Jupiter hypothesis.

4. The Analysis Before Any Sign Is Considered

Step 1 — Make a hidden first guess Make one immediate, intuitive Jupiter-sign guess, but do not reveal it. Set it aside completely. It has no privileged status and must not determine which evidence is selected, which concepts are emphasized, or how the person is described. The later analysis must be able to reach a different sign.

Step 2 — Identify the fundamental problem Ask:

- What does the person consider a fundamental problem?
- What is inadequate, missing, contradictory, misunderstood, or unresolved from their point of view?
- What is the actual problem they are trying to solve, beyond the subject matter?

Step 3 — Establish why the problem matters Ask what would remain wrong, incomplete, unintelligible, or unsatisfactory if the problem were not solved. Then ask, without using sign terminology: What makes this situation appear to be a meaningful problem worth addressing? Describe how something becomes visible as missing, contradictory, inadequate, significant, or in need of explanation. Do not treat the answer as a sign assignment, conscious motivation, instinct, or subconscious psychology. Trace three connected dimensions:

1. What becomes visible as a problem?

2. What becomes visible as an appropriate way to address it?

3. What becomes visible as a meaningful or legitimate result? Ask whether one underlying form of meaningful visibility connects them. If a proposed principle explains only the method or only the result, it may be incomplete.

Step 4 — Examine concepts and titles as research clues Ask:

- What are the key concepts and ideas?
- What are the book or work titles?
- What does each concept actually do in the person's intellectual system? Concepts and titles indicate where to focus attention; they do not directly determine Jupiter. Never use the shortcut concept → sign.

Step 5 — Reconstruct the problem–solution geometry Describe the movement: Problem → response → transformation → solution Understand the person's characteristic way of addressing the problem. Do not classify individual stages by signs.

Step 6 — Examine the relevant operation of fiction, where applicable For fiction writers, examine at least one central or especially revealing character. Ask:

1. What is the character's self-understanding?

2. What does the character actually do, experience, or reveal?

3. What discrepancy, transformation, recognition, or pattern becomes visible through the narrative?

4. What does this make intelligible about the character, other people, society, or existence?

5. Is that revelation central to the author's distinctive literary achievement, or merely one effect among others?

6. How does the character-level operation connect to the author's wider literary activity? Do not infer Jupiter directly from a character's personality, moral qualities, fate, or narrative role. Determine what the author does through the character and why that operation gives the work its distinctive meaning. Do not assume that every writer's central operation is revelation. It may instead be creation, discrimination, participation, relation, continuity, or something else. The evidence must decide. For poetry, essays, and other forms, examine the equivalent operation in language, form, argument, perception, or structure.

Step 7 — Identify the point of the whole project Ask:

- What is the point of this person's intellectual activity?
- Why are these concepts used?
- What does the work show?
- What operation recurs beneath different arguments, books, concepts, and methods?
- Which part or movement gives the project its distinctive intellectual force? An individual argument is evidence for understanding the whole, not automatically evidence for Jupiter. Do not classify all the parts and choose whichever sign appears most often.

Step 8 — Identify the production of meaning the person trusts In ordinary language, ask: What kind of production of meaning does this person ultimately trust, and why does that form of understanding present itself as meaningful or legitimate? Do not use zodiac terminology or name a sign. Do not answer only with the subject matter, method, key concepts, political or ethical goal, explicit justification, or stated philosophical foundation. The sign-free synthesis should make the source of legitimacy clear enough that it can later be compared with all twelve sign principles. Do not force the synthesis into a sign-shaped formulation. Possible descriptions might include meaning emerging through comparison between perspectives, through understanding necessary conditions, through penetrating beneath appearances, or through continuity with what came before. These are examples of sign-free descriptions, not sign assignments. A method can itself be the source of legitimacy. Do not assume either that method and legitimacy coincide or that they must be separate.

Step 9 — Complete and lock the sign-free synthesis No zodiac signs may be introduced before this step is complete. Stop the analysis and write a final sign-free synthesis answering:

- What is this person's intellectual activity doing overall?
- What is its crucial, distinctive movement?
- What kind of production of meaning does the person trust?
- What makes the central problem worth addressing, the approach intelligible as appropriate, and the decisive insight or result meaningful or legitimate?
- What is the relationship between the signature operation and the source of intuitive legitimacy? State the proposed form of meaningful visibility in ordinary conceptual language. Do not describe it as an instinct, conscious belief, subconscious mechanism, or merely an explicit justification unless the evidence supports that description. Lock this synthesis provisionally as the reference for sign assessment. Do not revise it just because a candidate sign is difficult to defend. Revise it only if new factual evidence, a demonstrable analytical error, or a genuinely better research question or method warrants revision. Explain the reason and reassess all twelve signs against the revised synthesis. If the source of legitimacy cannot be stated clearly without zodiac terminology, return to the factual analysis.

Step 10 — Step back and identify the signature operation Remove the person's terminology, technical machinery, individual arguments, work titles, and disciplinary vocabulary. Write 2–4 sentences answering: What is this person's intellectual activity doing overall? Then identify the signature meaning-producing operation:

1. What does this person repeatedly make visible, intelligible, or meaningful that might otherwise remain hidden, confused, unconvincing, or unproductive?

2. What specific operation produces that result?

3. Why is this more than a description of subject matter, method, structure, or audience effect?

4. What makes the resulting understanding or experience compelling in its own right?

---

5. Does the operation itself provide intuitive legitimacy, or does it serve another principle? State the operation in one or two precise sentences. Do not infer a sign yet. The aim is to identify the crucial, distinctive generative movement and the source of legitimacy that makes it meaningful—not to force every component of the person's activity into one principle.

---

5. Twelve-Sign Assessment — Still No Guess Only after the sign-free synthesis is complete may the twelve sign principles be introduced. The hidden first guess is discarded. Assess all twelve signs independently against the locked synthesis. Do not begin with the most obvious match, rank signs prematurely, or eliminate signs merely to reach another. For each sign, use the same template:

---

1. Target: What specific feature of the locked synthesis would this principle explain?

---

2. Legitimating principle: Why would that feature become meaningful or valid through this sign?

---

3. Positive evidence: What in the person's activity supports this interpretation?

---

4. Counterevidence or missing evidence: What weighs against it, or what necessary evidence has not been established?

---

5. Nearest competitor: Which other sign could explain the same evidence?

6. Discriminator: What specifically distinguishes this interpretation from the nearest competitor?

7. Legitimacy sentence: Complete “This person's production of meaning is trustworthy because …” Identify the source of intuitive legitimacy, not merely the activity or method.

8. Counterevidence test: What concrete observation or pattern would weaken this candidate, and is any such counterevidence present? A brief assessment is acceptable where there is little supporting evidence, but every sign must actually be considered. Apply the same evidential standards to all signs. Symmetry does not mean pretending they are equally plausible; it means evaluating them fairly at the same conceptual level. For every serious candidate, the legitimacy sentence must fit the locked sign-free synthesis. If a sentence only redescribes the activity, it does not yet establish Jupiter-level evidence. Do not demand that every candidate be equally well supported; demand that each be assessed by the same questions. Targeted boundary tests When any of the following pairs are serious competitors, explicitly test the distinction at the level of intuitive legitimacy. These tests supplement the full twelve-sign comparison; they do not replace it and need not be forced into analyses where the pair is not a serious competition.

- Gemini / Virgo: Does new intelligibility depend on crossing between distinct domains or perspectives, with the encounter generating something unavailable from either alone (Gemini)? Or does legitimacy depend on accurately discriminating what is actually present in the particular case (Virgo)? Ask

whether the crossing itself is constitutive of the distinctive understanding, or whether exact discrimination does the legitimating work. Either operation may be a method rather than the source of legitimacy; establish its role from evidence.

- Sagittarius / Pisces: Does a wider horizon change the meaning or status of a particular situation while the particular remains distinct (Sagittarius)? Or does the particular become meaningful through participation in a larger field in which its apparent separateness becomes less fundamental (Pisces)? Do not decide from breadth, universality, spirituality, wholeness, or interconnectedness alone.
- Leo / Capricorn: Does an already-existing possibility acquire concrete reality through the necessary participation of a particular subject or agent (Leo)? Or does legitimacy arise by working out the implications, conditions, consequences, scope, or limits of a given form or structure (Capricorn)? Do not decide from ambition, achievement, agency, discipline, or structural thinking alone. For each applicable pair, state what evidence would favor each side and identify the observation that would discriminate between them. If no meaningful discriminator survives, preserve the ambiguity rather than manufacturing a winner. Demanding final comparison After the full twelve-sign assessment, compare the leading candidate with its nearest competitor by answering all five questions:

1. What is the strongest positive evidence for the leading sign?

2. What is the strongest evidence for the nearest competitor?

3. What specific observation in the work would favor one over the other?

4. What does the leading candidate explain about the source of legitimacy that the competitor does not explain as well?

5. What counterevidence, missing evidence, or unresolved ambiguity remains? The discriminator must be grounded in the person's activity, not in a convenient restatement of the sign definitions. If both candidates explain the available evidence equally well, state theoretical ambiguity. If the evidence is too limited to compare them properly, state that evidence is insufficient and identify what kind of evidence would help. Do not confuse these two situations.
Sign-definition audit Before every prediction, check the authoritative Candidate Model and use its current definitions and boundaries accurately. Do not replace them with convenient shorthand or reinterpret them to fit the case. The definitions are revisable hypotheses, not fixed truths. Preserve existing formulations—including the precise Leo formulation—unless repeated, generalizable evidence reveals a genuine conceptual weakness. Do not change a definition merely because one answer was right or wrong. A single case can motivate a question for future testing; it cannot establish a general refinement.
Method and sign must not be confused A conspicuous operation is not automatically the Jupiter principle. For example:

- Precision may be Virgo without Jupiter being Virgo.
- Penetration may be Scorpio without Jupiter being Scorpio.
- Synthesis may be Aquarius without Jupiter being Aquarius.
- Continuity may be Cancer without Jupiter being Cancer.
- Broad interpretation may be Sagittarius without Jupiter being Sagittarius.
- Relation may be Libra without Jupiter being Libra.
- Exchange may be Gemini without Jupiter being Gemini—although if exchange itself is the final source of legitimacy, it may be Jupiter-level evidence. Ask: Is this sign describing what the person does, or why what the person does counts as meaningful? A candidate cannot win simply because its principle is compatible with the evidence. It must explain the source of legitimacy more specifically than its strongest competitors.

6. Current Jupiter Sign Principles These are the current working definitions. They remain provisional and may be refined when independent evidence supports a generalizable improvement.

Aries Principle: Intuitive legitimacy arises through an originary encounter or act that establishes something as present, significant, or real before it is mediated by a more elaborate conceptual structure. Geometry: Primary givenness → origination → the first act through which something enters intelligibility as real. Critical distinction: Legitimacy begins through the act itself. Not merely: Differentiation, novelty, independence, or action.

Taurus Principle: Intuitive legitimacy arises from what is immanently real and sufficient within its own existence. Something is meaningful or legitimate because of what it intrinsically is—not because an act first makes it salient or because it stands in a particular relation to something else. Geometry: Particular thing → intrinsic reality or whatness → apprehension of that reality → legitimacy. Guiding question: What is this thing in itself, when encountered in its actual being rather than through abstractions or projections imposed upon it? Critical distinction: Something possesses significance through its own actuality, without requiring external validation or a deeper process to confer its reality. This does not mean Taurus denies causes, relations, or depth; they may be present, but they are not necessarily what makes the thing meaningful. Boundary with Scorpio: Taurus asks what is real in and through the thing itself; Scorpio asks what formative reality or process produces the thing's apparent form. Not merely: Concreteness, materiality, stability, or factuality.

Gemini Principle: Intuitive legitimacy arises through correspondence or translation between distinct domains, where crossing between them generates new intelligibility. Geometry: Domain A → limit of intelligibility → correspondence or translation → Domain B → new intelligibility unavailable from A alone. Critical distinction: Distinct perspectives encounter one another and generate intelligibility through that encounter. The domains may be conceptual, experiential, representational, or structural. Gemini can also operate through correspondence between different presentations or modes of givenness of the same thing. Not merely: Communication, comparison, similarity, or the presence of multiple perspectives.

Cancer Principle: Something becomes meaningful because a prior or inherited reality is carried forward into the present, so that the present particular contains or expresses its own living continuity. Geometry: Past or inherited reality → carried into the present → transformed continuation → present meaning. Critical distinction: Continuity is constitutive. The past does not merely provide background context for the present; it remains present within the present's own form. Not merely: History, tradition, context, or emotional attachment.

Leo Principle: A possibility acquires concrete reality and meaning through its realization by a particular subject or agent. Geometry: Existing possibility → need for realization → particular subject or agent → realization → possibility becomes actual. Critical distinction: The agent does not create the possibility itself. The possibility already exists; the particular subject is the vehicle through which it becomes actual. The key distinction is between a subject merely causing something to happen and the subject's participation being necessary for that possibility to acquire its particular meaning or actuality. Not merely: Authorship, self-expression, ego, or creating the possibility itself.

Virgo Principle: Something becomes legitimately understandable or actionable when the distinctions, requirements, and structure actually present in a particular situation are accurately discriminated rather than projected onto it. Geometry: Undifferentiated field → exact discrimination → actual structure or requirements become clear → valid understanding or response. Critical distinction: Legitimacy comes from discerning what is actually present, precisely rather than approximately. Not merely: Precision, analysis, classification, or detail as methods

in themselves.

Libra Principle: Intuitive legitimacy arises through the meaningful relation between distinct elements when that relation itself produces or reveals a valid form of meaning. Geometry: A ↔ B → the relation becomes meaningful or operative → the validity of the meaning emerges. The relation is not merely a method for comparing things whose meanings are already established. The interaction or configuration between them is what makes the meaning intelligible. Critical distinction: Legitimacy arises through a meaningful relation between distinct elements. Not merely: Relation, cooperation, balance, comparison, or consideration of multiple perspectives by themselves.

Scorpio Principle: Intuitive legitimacy arises through penetration beneath an apparent form to the formative reality or process that produces it. Geometry: Apparent phenomenon → penetration or disclosure → formative reality → understanding. Critical distinction: What lies beneath the surface is not merely deeper or hidden; it is what produces, structures, or determines the appearance. Boundary with Taurus: Scorpio's underlying reality matters because disclosing it explains how or why the appearance comes to be. Taurus's reality is meaningful through its own immanent actuality, even when no deeper formative explanation is needed to establish its significance. Scorpio does not win merely because an account mentions causes or hidden factors, and Taurus does not win merely because it affirms the reality of a thing. Not merely: Depth, hiddenness, secrecy, psychology, or looking beneath the surface.

Sagittarius Principle: A particular situation becomes meaningful, or its apparent problem changes status, when it is understood within a more comprehensive horizon that exceeds the immediate situation. Geometry: Local phenomenon or problem → expansion of horizon → larger principle or context → transformed intelligibility. Critical distinction: The larger horizon does explanatory work; this is not merely broad thinking. Not merely: Breadth, universality, abstraction, philosophy, or generalization.

Capricorn Principle: A form, proposition, relation, or conceptual structure becomes legitimately meaningful when its implications, scope, consequences, and conditions of application are worked out. Geometry: Given form or structure → work through it → determine implications and limits → establish legitimate scope. Critical distinction: The crucial idea is entailment. Capricorn asks: If this structure is what it claims to be, what does it actually entail? Not merely: Structure, discipline, rules, authority, or practicality.

Aquarius Principle: Intuitive legitimacy arises through grasping and/or reorganizing the abstract architecture of a field. A phenomenon becomes intelligible when its position within an impersonal system of relations, categories, rules, or structures is understood—and, where necessary, the architecture itself can be reorganized. Geometry: Apparently separate phenomenon → abstract architecture → systemic organization → reconfiguration/new intelligibility. Critical distinction: The legitimating work is done by understanding how the phenomenon is positioned within the field's abstract architecture and, where needed, by reorganizing that architecture so the field becomes intelligible in a new way. Not merely: Objectivity, systematization, abstraction, innovation, or impersonality.

Pisces Principle: Intuitive legitimacy arises through participation in a larger field of meaning, within which apparently separate boundaries become less fundamental. What appears to be an isolated thing, person, or position becomes meaningful through participation in a larger field of relations, forces, perspectives, or becoming. Geometry: Apparently separate particular → immersion or participation → isolated boundaries become less fundamental → larger field. Not merely: Unity,

spirituality, interconnectedness, or holism.

7. Boundary Comparisons These comparisons are controls for distinguishing principles, not extra sign meanings or a checklist that every candidate must pass. Compare signs at the same level: the source of intuitive legitimacy—not subject matter, mechanism, method, product, explanatory depth, necessity, or surface resemblance. The decisive question is always: What is actually doing the legitimating work? Aries boundaries

- Aries / Taurus: Aries—legitimacy begins through an originating act. Taurus—legitimacy belongs to what is intrinsically real in itself.
- Aries / Leo: Aries—the act of origination establishes legitimacy. Leo—a particular subject's participation realizes an already-existing possibility.
- Aries / Capricorn: Aries—legitimacy does not depend on prior determining conditions. Capricorn—legitimacy derives from conditions that make something possible.
- Aries / Gemini: Aries—meaning begins through origination. Gemini—meaning emerges through encounter between distinct elements. Taurus boundaries
- Taurus / Aries: Taurus—intrinsic being. Aries—origination.
- Taurus / Leo: Taurus—intrinsic reality. Leo—an existing possibility becomes actual through a particular subject or agent.
- Taurus / Capricorn: Taurus—what something intrinsically is. Capricorn—the conditions necessary for it to exist.
- Taurus / Cancer: Taurus—the thing's immanent reality. Cancer—what the particular carries within itself through continuity.
- Taurus / Scorpio: Taurus—reality is meaningful through its own actuality. Scorpio—disclosing the formative process explains how or why an appearance is produced. Ask what does the legitimating work; neither “intrinsic” nor “hidden cause” is enough by itself. Gemini boundaries
- Gemini / Libra: Gemini—interaction generates something new. Libra—the relation itself becomes meaningful or legitimate.
- Gemini / Aries: Gemini—meaning emerges through encounter. Aries—meaning originates through an initiating act.
- Gemini / Virgo: Gemini—distinctions between perspectives generate new meaning. Virgo—distinctions determine what is actually present.
- Gemini / Aquarius: Gemini—distinct domains encounter one another and generate new intelligibility. Aquarius—a phenomenon becomes intelligible through its position within an abstract architecture, which may be reorganized when needed. Cancer boundaries
- Cancer / Taurus: Cancer—meaning comes from what the particular carries through continuity. Taurus—meaning comes from intrinsic being.
- Cancer / Capricorn: Cancer—an inherited reality shapes emergence. Capricorn—necessary conditions determine how something can exist.
- Cancer / Sagittarius: Cancer—meaning comes from prior embeddedness. Sagittarius—meaning comes from placement within a wider horizon.

- Cancer / Pisces: Cancer—the particular remains constituted by its prior continuity. Pisces—the particular becomes meaningful through participation in a larger field. Leo boundaries
- Leo / Aries: Leo—a subject's necessary participation realizes an already-existing possibility. Aries—legitimacy belongs to the originating act.
- Leo / Taurus: Leo—a possibility acquires actuality through a particular subject or agent. Taurus—something is legitimate through intrinsic reality.
- Leo / Sagittarius: Leo—the particular subject is the vehicle through which an existing possibility becomes actual. Sagittarius—the particular gains significance through a larger horizon.
- Leo / Libra: Leo—legitimacy arises through a subject's necessary participation in realization. Libra—legitimacy emerges through the meaningful relation between distinct elements. Virgo boundaries
- Virgo / Gemini: Gemini—distinctions interact and generate new intelligibility. Virgo—distinctions clarify what is actually present.
- Virgo / Scorpio: Virgo—determines what is present. Scorpio—penetrates toward what generates what is present.
- Virgo / Capricorn: Virgo—determines what actually exists in a particular case. Capricorn—determines what must be in place for something to be possible.
- Virgo / Taurus: Virgo—legitimacy comes through accurate discrimination. Taurus—legitimacy comes through intrinsic reality itself. Libra boundaries
- Libra / Gemini: Libra—the relation itself becomes meaningful. Gemini—interaction generates something new.
- Libra / Taurus: Libra—legitimacy emerges between distinct realities. Taurus—legitimacy comes from intrinsic reality.
- Libra / Leo: Libra—legitimacy comes through relation. Leo—legitimacy comes through a subject's participation in making an existing possibility actual.
- Libra / Aquarius: Libra—the meaningful relation between elements is itself the source of legitimacy. Aquarius—legitimacy comes from grasping how a phenomenon is positioned within an abstract architecture of the field, which may be reorganized to make it intelligible. Scorpio boundaries
- Scorpio / Taurus: Taurus asks what is meaningful in a thing's own immanent actuality. Scorpio asks what formative reality or process produces its apparent form, and how disclosing that process makes the form intelligible.
- Scorpio / Virgo: Virgo asks what is actually present. Scorpio asks what generates what is present.
- Scorpio / Capricorn: Scorpio identifies the generative reality or process producing the phenomenon. Capricorn identifies the necessary conditions governing its possibility.
- Scorpio / Aquarius: Scorpio penetrates toward the formative process that produces the appearance. Aquarius grasps the abstract architecture that organizes the phenomenon's position in a field and may reorganize that architecture to yield new intelligibility.
- Scorpio / Pisces: Scorpio penetrates into the particular to discover what generates it. Pisces immerses the particular in a larger field in which its boundaries become less fundamental. Sagittarius boundaries
- Sagittarius / Cancer: Sagittarius—significance comes from a wider horizon. Cancer—significance comes from prior embeddedness and continuity.
- Sagittarius / Capricorn: Sagittarius—a larger horizon determines significance. Capricorn—necessary conditions determine possibility.
- Sagittarius / Pisces: Sagittarius—the particular remains distinct while gaining meaning through a larger horizon. Pisces—the particular gains meaning through participation in the larger field itself.
- Sagittarius / Leo: Sagittarius—the particular gains legitimacy from a larger horizon. Leo—a particular subject or agent realizes an existing possibility. Capricorn boundaries Core question: What does a given form, proposition, relation, or conceptual structure actually entail—including its conditions, implications, scope, consequences, and limits? Capricorn is not simply “structure.” Its legitimating

operation is to work through a form and establish what follows from it and where it legitimately applies.

- Capricorn / Aries: Capricorn asks which conditions make something possible or valid. Aries locates legitimacy in the originating act itself, rather than in prior determining conditions.
- Capricorn / Taurus: Capricorn asks what conditions or implications follow from a form. Taurus asks what is meaningful through the thing's intrinsic, immanent actuality.
- Capricorn / Gemini: Capricorn works out what a given structure entails. Gemini generates new intelligibility by translating or establishing correspondence between distinct domains.
- Capricorn / Cancer: Capricorn identifies conditions and implications that govern what can follow. Cancer emphasizes how a prior reality is carried forward and remains constitutive of the present.
- Capricorn / Leo: Capricorn asks what conditions and consequences follow from a possibility or structure. Leo asks how a particular subject's participation is necessary for an already-existing possibility to become actual.
- Capricorn / Virgo: Virgo discriminates what is actually present in the particular case. Capricorn works out what must follow, or be in place, for a form or proposition to hold.
- Capricorn / Libra: Capricorn establishes the implications, conditions, and legitimate scope of a form. Libra locates legitimacy in the meaningful relation between distinct elements itself.
- Capricorn / Scorpio: Capricorn identifies necessary conditions and entailments. Scorpio discloses the formative reality or process that produces an apparent form.
- Capricorn / Sagittarius: Capricorn asks what a given structure entails and where it applies. Sagittarius makes a situation intelligible by placing it within a more comprehensive horizon.
- Capricorn / Aquarius: Capricorn works through a given form or structure to establish its implications, conditions, consequences, scope, and limits. Aquarius grasps the abstract architecture that organizes a field and may reorganize that architecture to make the field intelligible in a new way. Capricorn asks, “If this structure is what it claims to be, what follows from it?” Aquarius asks, “What architecture organizes these phenomena, and does that architecture itself need to be reconceived?”
- Capricorn / Pisces: Capricorn establishes the implications and legitimate scope of a particular form. Pisces makes the particular meaningful through participation in a larger field in which boundaries become less fundamental. Do not choose Capricorn merely because the work is rigorous, systematic, formal, or concerned with conditions. The evidence must show that working out entailments, conditions, consequences, or legitimate scope performs the legitimating work. Aquarius boundaries Core question: How does a phenomenon become intelligible through its position within the abstract architecture of a field—and does that architecture itself need to be reorganized? Aquarius is not simply “structure,” abstraction, systematization, or innovation. Its legitimating operation is to grasp and/or reorganize the impersonal architecture of relations, categories, rules, or structures that positions phenomena within a field.
- Aquarius / Aries: Aquarius makes a phenomenon intelligible through the architecture organizing its position in a field, potentially reorganizing that architecture. Aries locates legitimacy in an originary act that establishes something as present or significant.
- Aquarius / Taurus: Aquarius explains a phenomenon through its position in an abstract architecture. Taurus locates significance in the thing's own immanent actuality, without requiring a system to confer its reality.
- Aquarius / Gemini: Gemini generates new intelligibility through exchange or translation between distinct domains. Aquarius makes phenomena intelligible through their positions within an abstract architecture, which may itself be reorganized.
- Aquarius / Cancer: Aquarius grasps the impersonal architecture organizing a field. Cancer emphasizes a prior reality carried forward as constitutive continuity within the present.
- Aquarius / Leo: Aquarius makes the field intelligible through its abstract architecture and possible reorganization. Leo locates the realization of an existing possibility in the necessary participation of a particular subject or agent.

- Aquarius / Virgo: Virgo accurately discriminates what is actually present in a particular situation. Aquarius grasps the abstract architecture that organizes how phenomena relate and occupy positions across the field.
- Aquarius / Libra: Libra locates legitimacy in the meaningful relation between distinct elements itself. Aquarius locates legitimacy in grasping how those elements and relations are positioned within the abstract architecture of the field, potentially reorganizing that architecture.
- Aquarius / Scorpio: Scorpio penetrates toward the formative reality or process that produces an apparent form. Aquarius grasps the abstract architecture that organizes the phenomenon's position within a field. A causal explanation is not automatically Aquarius; a system is not automatically Scorpio.
- Aquarius / Sagittarius: Sagittarius makes a particular situation meaningful by placing it within a more comprehensive horizon. Aquarius makes it intelligible through its position within an abstract architecture of relations, categories, rules, or structures. A larger context is not necessarily an architecture; an architecture is not merely a wider horizon.
- Aquarius / Capricorn: Aquarius grasps and/or reorganizes the abstract architecture of a field to produce new intelligibility. Capricorn works through a given form or structure to determine its implications, necessary conditions, consequences, scope, and limits. Aquarius asks, “How is this field architecturally organized, and should that organization change?” Capricorn asks, “If this structure is what it claims to be, what does it entail?”
- Aquarius / Pisces: Aquarius makes a phenomenon intelligible through its position in an abstract architecture, with relations and distinctions understood systemically. Pisces makes the particular meaningful through participation in a larger field in which its boundaries become less fundamental. Do not choose Aquarius merely because the work is abstract, systematic, impersonal, innovative, or concerned with relationships. The evidence must show that grasping or reorganizing the field's abstract architecture performs the legitimating work. Pisces boundaries
- Pisces / Sagittarius: Sagittarius—the particular remains distinct but gains significance through a larger horizon. Pisces—the particular participates in the larger field itself.
- Pisces / Aquarius: Aquarius—intelligibility comes through a phenomenon's position within an abstract architecture. Pisces—the particular becomes meaningful through participation in a larger field.
- Pisces / Cancer: Cancer—the particular contains and continues a prior reality. Pisces—the particular participates in a larger field beyond its own inherited continuity.
- Pisces / Scorpio: Scorpio—penetrates toward what generates the particular. Pisces—makes the separation between particular and surrounding field less fundamental. These comparisons prevent a sign from being chosen merely because its description sounds attractive. They require an explanation of why the sign fits better than its closest structural alternatives.

8. Final Inference and Pre-Prediction Audit

Step 11 — Select a sign only after the complete comparison Only now ask: Which of the twelve principles best describes the source of intuitive legitimacy uncovered by the analysis? The final sign must explain the source of legitimacy in the crucial, distinctive production of meaning and its consequential generative role in the intellectual project. Do not choose the sign that explains the most individual statements, the most dramatic moment, or the greatest number of surface features. The whole activity is the evidence base for identifying and testing the crucial part; the sign need not explain every component. If two or more principles are genuinely close, compare them after the full twelve-sign field has been considered.

Mandatory pre-prediction audit Before presenting the prediction, check:

1. Did I identify the source of intuitive legitimacy rather than merely describe the topic, method, structure, product, goal, validation standard, or explicit doctrine?

2. Did the sign emerge from the evidence, or did I reinterpret the evidence to fit the sign?

3. Did I test the strongest alternatives against the same locked synthesis and evidential standards?

4. Am I rejecting an alternative because of contrary evidence, or because I have already committed to another sign?

5. Would this reasoning still support the selected sign if all previous guesses and rejected signs were hidden?

6. Is the selected sign more discriminating than the alternatives, or merely compatible with the person?

7. Is the evidence appropriate to the phenomenon and timescale the proposed planetary function is meant to explain?

8. Have I stated the strongest positive discriminator against the nearest competitor?

9. Am I identifying how the sign operates through Jupiter's function, rather than relying on a general sign resemblance?

11. Have I checked whether another planetary function could explain the same feature, without treating that possibility as automatic disproof?

---

12. If Jupiter shares its sign with a personal planet, have I kept their functions distinct and prevented that overlap from becoming proof or post-hoc rescue?

---

13. Have I completed the Mandatory legitimacy sentence for each serious candidate, and does it identify the source of legitimacy rather than merely the activity?

---

14. Have I identified what would count against the leading candidate, rather than only collecting compatible evidence?

---

15. Have I completed the five-part comparison with the nearest competitor and stated a genuine discriminator—or explicitly reported ambiguity or insufficient evidence? If the audit reveals a substantive failure, revise the analysis before presenting a guess. If the evidence does not discriminate, state uncertainty rather than manufacturing a winner.

---

9. Reassessment After a Rejected Guess A rejected guess establishes that the prediction failed. It does not provide positive evidence for any alternative. Independent reassessment If the result is uncertain or a guess is rejected:

---

1. Return to the factual record and the locked sign-free synthesis.

2. Reopen the field of live candidates; do not mechanically move to the nearest competitor.

3. For each live candidate, state what positive evidence its principle would require.

4. Check whether the person's activity supplies that evidence.

5. Reassess the candidates independently, using the same standards.

6. Do not reinterpret the person to fit the remaining candidates.

7. Revise the sign-free synthesis only when new factual evidence or a demonstrable analytical error warrants it. Explain the reason and reassess all live candidates if it changes. A previously rejected sign must be removed from that person's candidate pool for the current guessing sequence. Do not guess it again in that sequence or use it as a fallback, contrast, or interpretive clue. Its exclusion constrains the permitted answer; it is not evidence for another sign. For a later, separately initiated blind retest, follow the answer-independence rule: make a fresh prediction without using the old answer or person-specific history, then compare after commitment. Clean-reassessment checklist

- Return to the locked sign-free synthesis before examining prior sign assessments.
- Re-state each live sign's foundational principle in its own terms.
- Ask what positive evidence would support that principle as the source of legitimacy and what would count against it.
- Check for confusion between subject matter, method, mechanism, product, goal, explicit justification, and intuitive legitimacy.
- Inspect earlier reasoning only after the fresh assessment, to identify anchoring, omissions, or errors—not to inherit its conclusions.
- Apply the same evidential standard to every live candidate.
- If a sign definition or boundary was misapplied, correct the model explicitly; do not alter the person’s synthesis merely to fit a candidate.
- Never let a shrinking candidate pool count as evidence.
- If the remaining candidates cannot be discriminated positively, state uncertainty. Escalation after repeated failures
- After three rejected guesses: Return to primary or authoritative sources. Verify the factual basis and determine whether the problem is missing evidence, an inaccurate account, or confusion between mechanism and legitimacy.
- After six rejected guesses: Stop sequential guessing. Conduct one complete comparative reassessment of every remaining candidate using the same evidence and locked synthesis. If the evidence cannot distinguish them, report uncertainty rather than generating further plausible interpretations. Do not rotate through signs or write increasingly elaborate rationales for a shrinking candidate pool. A new guess is warranted only when reassessment produces a positive, evidence-based discriminator.

10. Learning from Outcomes and Benchmarking

10.1 Before the answer is revealed Complete the analysis under the full methodology. Research the person, lock the sign-free synthesis, assess all twelve signs symmetrically, and commit to the prediction before receiving or consulting a reference answer. If the person has been analysed before, stored answers, previous guesses, and person-specific reasoning must not influence the fresh prediction.

10.2 After the user reveals the answer Record the revealed sign and the prediction outcome. Keep the answer key distinct from the analysis and guess history. A correct answer is a reference label for evaluation; it does not prove that the reasoning was sound. A rejected guess is a known error for that attempt, not evidence that a particular alternative is correct.

10.3 Review the reasoning critically After an outcome, ask:

- What does it reveal about the reasoning process, independently of the answer?
- Was there an analytical-level error?
- Was positive discrimination insufficient?
- Was a sign definition too broad, too narrow, ambiguous, or insufficiently distinguished from a neighbour?
- Were there research gaps?

- Was selection, production, validation, or final legitimacy confused with another?
- Would a general refinement improve discrimination across multiple cases? A correct answer alone does not validate the reasoning. Do not revise definitions merely to rationalize a correct answer. A single case can expose a weakness or suggest a question, but does not establish a general refinement.

10.4 Keep two logically separate records Maintain:

1. Answer key and benchmark history: confirmed answers revealed by the user, predictions, guess order, outcomes, and attempt counts.

2. General learning log: reusable lessons about sign principles, boundaries, evidence quality, research practice, and inference errors. The general learning log may be informed by outcomes, but should not preserve a person's identity or recognizable profile as a disguised answer key. Person-specific answers may be retained as benchmark data, subject to the blind-retesting rule.

10.5 Benchmark performance Where sufficient records exist, track:

- First-guess accuracy.
- Accuracy within a specified number of guesses, such as three.
- Mean or median guesses required to reach the revealed answer.
- Clean-retest accuracy on previously tested people.
- Performance before and after a methodological revision.
- Reasoning quality, especially positive evidence that discriminates the selected sign from alternatives. Keep first-guess accuracy distinct from eventual success after repeated guesses. Do not claim the model improved merely because it eventually reached the answer after exclusions. When comparing versions, record the methodology used and apply comparable scoring rules.

11. Revising the Method and Model

11.1 The method is an instrument, not a fixed ritual The procedure exists to improve prediction, not to be followed mechanically for its own sake. Questions may be added, reworded, reordered, or abandoned; new sources may be examined; and alternative analytical procedures may be tried when they are likely to reveal something the current procedure misses. The numbered sequence is a set of safeguards against premature conclusions, not an inflexible ritual.

11.2 Preserve the aim and evidential standards Methodological flexibility does not permit arbitrary conclusions. Any change should address a specific difficulty, missing distinction, research gap, or recurring error. Do not change the method to rescue a preferred sign, justify an answer already revealed, or make one case appear coherent after the fact. Preserve blind prediction, positive discrimination, consistent evidential standards, and separation between the answer key and prediction process.

11.3 Separate discovery from evaluation During discovery, explore alternative questions, sources, theoretical formulations, and methods. During evaluation, assess predictions using consistent criteria. An elegant interpretation has not necessarily improved prediction. A method that improves one case may be overfitting if it fails elsewhere. Where possible, evaluate changes across multiple cases and blind retests.

11.4 Changes must earn their place Treat methodological and theoretical changes as hypotheses about improving performance. For a proposed formal change, state:

1. The recurring problem observed.

2. The specific change proposed.

3. The evidence motivating it.

4. The expected benefit.

5. How the change could be evaluated. Do not announce a change as successful on the basis of one example. If it repeatedly fails to improve performance, or worsens it, revise or abandon it unless there is a clear reason the available test was inadequate. If results are inconclusive, continue testing provisionally.

11.5 Diagnose the right level after a failure Consider at least four possibilities:

1. The factual account was incomplete or inaccurate.

---

2. The research questions or method failed to reveal relevant evidence.

---

3. A sign principle or boundary was misapplied.

---

4. The underlying model of Jupiter or the sign–manifestation relationship is inadequate. Do not automatically blame the sign assignment alone, and do not automatically protect the theory. Diagnose which level is most plausibly responsible, while allowing that the evidence may not distinguish them.

11.6 Keep sign definitions revisable, but distinct The current hypothesis is that Jupiter is an underlying function and the sign gives that function its characteristic manifestation. The account of Jupiter as intuitive legitimacy may be refined or replaced if repeated, independent evidence warrants it. Sign descriptions and boundaries may also be revised when revisions improve discrimination. However, revisions must preserve meaningful distinctions between signs. Do not assume either that current definitions are final or that all differences can be dissolved into one undifferentiated principle. A single revealed case can motivate a question for future testing, but it does not establish a general refinement. Do not modify definitions merely to preserve or rationalize a particular guess.

11.7 Avoid overfitting and premature rejection

- Overfitting: changing the theory or method to explain each revealed answer, making past cases fit while weakening blind prediction.
- Premature rejection: abandoning a potentially useful method after one unsuccessful guess or too little evidence. Reduce both risks by recording predictions and outcomes, preserving answer-key separation, evaluating changes across multiple cases where possible, and treating conclusions about performance as provisional when the sample is small. The purpose is to improve both predictive performance and the quality of the structural model. If no genuine general lesson emerges, leave the model unchanged. Candidate Model 3.0 change note This edition adds three provisional application safeguards: (1) a Mandatory legitimacy sentence and explicit counterevidence question for every serious candidate; (2) targeted tests for Gemini–Virgo, Sagittarius–Pisces, and Leo–Capricorn when those pairs are genuine competitors; and (3) a five-part final comparison that separates positive evidence, counterevidence, a concrete discriminator, comparative explanatory advantage, and unresolved uncertainty. It also emphasizes the distinction between theoretical ambiguity and insufficient evidence. These additions do not replace or redefine the existing sign principles. Their value must be assessed through blind predictive performance and reasoning quality across cases; they must not be declared successful merely because they produce more elaborate interpretations.

12.

Compact Operational Checklist Use this as the short working sequence. The fuller sections above govern whenever more detail is needed.

1. Hidden first guess: make it, conceal it, and set it aside.

2. Fundamental problem: identify what the person is trying to resolve.

3. Why it matters: identify what would remain inadequate or unintelligible.

4. Research clues: examine concepts and titles without inferring a sign from them.

5. Problem–solution Geometry: reconstruct the person's characteristic response and transformation.

6. Signature operation: examine how the work actually produces meaning.

7. Whole-project synthesis: identify the crucial, distinctive generative movement.

8. Production versus legitimacy: distinguish method, structure, product, validation, horizon, and final source of legitimacy.

9. Lock the sign-free synthesis: do not introduce zodiac terminology yet.

10. Step back: describe the activity in 2–4 ordinary-language sentences and state the signature operation.

11. Assess all twelve signs: use the authoritative definitions, the same template, and positive discrimination.

12. Compare nearest competitors: identify the strongest discriminator and counterevidence; complete the five-part Demanding final comparison.

13. Legitimacy test: for every serious candidate, complete “This person's production of meaning is trustworthy because …” and identify what would count against it.

14. Apply relevant Targeted boundary tests (Gemini–Virgo, Sagittarius–Pisces, Leo–Capricorn) without replacing the full twelve-sign comparison.

15. Audit: verify that the sign describes the source of legitimacy, not merely the activity; check competing planetary explanations and counterevidence.

16. Predict: select a sign only after the full comparison; distinguish theoretical ambiguity from insufficient evidence, and state uncertainty when discrimination fails.

15. After rejection: reassess independently; never rotate through signs or treat exclusion as evidence.

16. After the answer is revealed: evaluate the reasoning, record the benchmark, and keep person-specific answers out of future blind predictions.

17. Improve the model cautiously: retain only generalizable changes supported by repeated evidence and evaluated predictive performance.

Governing logic Understand → synthesize → step back → lock → assess all twelve signs → discriminate → predict → evaluate. Do not guess a sign and interpret the person through it. Do not select the sign that appears most often in sign-like descriptions. Understand the person first, identify how the problem, approach, and result become meaningful, reconstruct the implicit form of meaningful visibility, and only then ask which Jupiter principle describes it. The method serves the investigation. Change it when evidence provides a reason; keep a change only when it improves analytical quality and, above all,

predictive performance.
